EXPERTISE IN MEDICATION DELIVERY

# BAG FOR RECONSTITUTION AND ADMINISTRATION OF MEDICATIONS

The reconstitution and administration of the active principles represent the most critical phase of the management process.

**The Institute for Safe Medication Practices – USA** has drafted a list of High-Alert Medications, which are the drugs that require special management and use attention, due to their potential toxicity, their low therapeutic index and their high interaction possibility, for example:

Adrenergic agonists, general intravenous anesthetic agents, local injectable anesthetic agents, neuromuscular blocking agents, antithrombic agents (anticoagulants), Heparin, Warfarin, Antiarrhythmic agents, Antineoplastics, Psychoactive drugs, Opioids, Intravenous Benzodiazepines, Digoxin, Insulin, Oral Hypoglycemics, Nitroprusside Sodium, Hypertonic Sodium Chloride for injection concentrate, Potassium Chloride for injection concentrate, Potassium Phosphates injection, Calcium injection, Magnesium sulfate injection.

reconstitution  
and  
administration

**FILLChoice® Dose**  
dosed reconstitution  
and  
administration

**FILLChoice® Instillation**  
reconstitution  
and  
instillation

## SAFETY

- Closed circuit <sup>(1)</sup>
- Needle free system
- Drug evidence during the administration to the patient

## EFFICACY

- High drug compatibility/adverse drug interaction control <sup>(2)</sup>
- Minimum drug waste
- Easy to use

## CONVENIENCE

- Time saving
- Reduced materials
- Cost control

(1) Investigation for evaluation of the efficacy of the microbial barrier in the FillChoice® system.

Title: Physical and microbiological tests as proof of "closed circuit". Final report by Technical Department Haemopharm Healthcare, June 2010.

(2) Type of intravenous solution, bag volume, bag material and connectors at request according to the active principle to reconstitute.
