

NEEDLELESS INJECTION POINT

Revolution in needle-free connectors

PATENTED

“NEEDLELESS INJECTION POINT”

Injection point for needle-free access with hermetic closure

Healthcare professionals face every day high risks from accidental needle sticks with potentially contaminated needles. NIP is a needlefree connector designed to cope with these critical issues, compliant with safety recommendations in the healthcare professional field and market trends that are moving towards greater safety for the health of operators and patients.

Thanks to its patented internal geometry, NIP® is the needlefree connector which ensures a hermetic closure before and after its connection. Particularly suitable with bags that contain sterile liquids.

NIP® ADVANTAGES

NIP® can be used to access the bag directly with the needle-free syringe, avoiding accidental needle sticks and thus improving the safety of healthcare personnel and patients.

Thanks to its hermetic closure, NIP® can replace the classic injection points and luer fittings with fracture cone and can be used as a connection to the bag of infusion sets, avoiding the use of spikes.

ABOUT NEEDLEFREE CONNECTIONS

Every day, health care workers are exposed to dangerous and deadly bloodborne pathogens (like HIV, Hepatitis C and B and other deadly diseases) through contaminated needlesticks. Furthermore, there can be inadvertent contaminations or exposures to sometimes-toxic drugs, including needlesticks during the preparation of hazardous drugs. Needlestick injuries may occur for a variety of reasons, including the types of device used and procedures undertaken, lack of training on safe use and disposal of needles, and lack of knowledge of the consequences of such injuries. It is one of the greatest risks faced by the frontline health care worker. FDA regulations and market tendencies are moving towards needlefree systems which are more secure to care givers for avoiding needle sticks accidents and to patient for improving the safety: there is solid evidence that needleless devices with safety features significantly reduce needlestick injuries.
